During 1996 to 1998 Gwinnett County developed a 50-year Water and Sewer Master Plan that outlined the water and sewer service for the County from then until projected build out (2050). The plan included the construction of The F. Wayne Hill Water Resources Center. The F. Wayne Hill Water Resources Center (FWHWRC) is one of the most technologically advanced treatment facilities in the country, with a design capacity of 60 million gallons per day. The treatment facility includes both primary and secondary treatment unit processes that generate residuals that are anaerobically digested and dewatered. Additional liquid train treatment processes include advanced membrane filtration facilities that produce a very high-quality effluent, which is returned to Lake Sydney Lanier, a major recreational and water supply source for Metro Atlanta.
